RUBRIC SELF-CHECK

Mapping the Submission to the Rubric

One line per Canvas criterion: whether Proficient is met, the evidence, and what is still open.

Vijayalakshmi Ramu | October 2026 | github.com/Viji-qmofi/first-microservices-Viji-R-agentic-harness-cicd

THE SELF-CHECK IN FOUR LINES

1. Each of the 13 Canvas criteria is mapped to the files that evidence it, in the rubric's own order. **No scores are claimed**: the grader assigns those.
2. **9 criteria meet every Proficient requirement, 2 meet them with a stated note, and 2 are for the grader to judge** (Clarity & Flow and Design, which depend on the video and the PDFs).
3. The largest open items: the 15-minute test was run on Windows only, the live budget guards have not been seen stopping a real run, and roles are self-declared.
4. Every claim points to a file, a log, a pull request or a run. Open items are listed beside the criterion they affect.

Proficient (3) is the rubric's pass line. Exemplary (4) elements are listed only where the evidence exists.

Criterion	Proficient (3)	Evidence to open	Exemplary (4) elements, and what is open
Workflow Scoping	Met	`module4_doc/workflow-scoping.md`: stakeholder, trigger, inputs, outputs, acceptance criteria, failure modes, demo needs, three alternatives argued, artifact gaps listed.	Quantified before-state, and why a custom pipeline beats a prebuilt agent or a script, argued with our own evidence. Open: the 45+ minute manual baseline is an estimate. The orchestrated roles are scoped to the order service.
Sandboxed Environment	Met	`Dockerfile`, `setup.md` (network egress, parallel-session isolation, security decisions, residual risks, fresh-clone test: about 7 minutes), README run path with a verify step.	Prerequisites, commands and a check are in the README. Open: Windows only, and agent sessions use the default network (a documented exception), so the container is not claimed airtight.
Quality Spec & Baseline	Met, with a note	`docs/prd.md`; `docs/rubric.md` (levels 1 to 4, thresholds); `docs/iteration-log.md` Run 001 and later runs.	Thresholds are tied to a business outcome (rubric section 1.4), and design alternatives are noted (ADR-003). Note: the review-latency baseline is an estimate (about 2 minutes), and the timed review was done once.
Agents, Skills & Memory	Met	`agents/`, two skills (`summarize-session`, `verify-before-trusting`), `module2_doc/memory-architecture.md`, `docs/reflection-log.md` (six entries).	Reflection entries show before and after scores or results, and a stale entry was archived with a reason (`decision-002`). Open: one pruned entry, so pruning is not yet a routine.

Criterion	Proficient (3)	Evidence to open	Exemplary (4) elements, and what is open
Orchestration & MCP Tools	Met, with a note	`docs/orchestration-diagram.md`, `docs/routing-and-tool-grant-map.md`, storage and retrieval servers with schemas, classification and citations, retrieval quality report (5 of 6).	Grants are narrow and the servers are validated and citation-bearing. Note: there is no separate tester role. Testing is a deterministic step (ADR-001, ADR-006). One retrieval query (Q4) is a documented known gap.
Evaluation & Calibration	Met	Harness with 13 deterministic checks and 4 rubric dimensions; 6 holdout tasks; run logs in `.eval-artifacts/`; `module3_doc/calibration-log.md`.	Normal, edge and adversarial cases; regression checks; entries cite scores (CAL-01 went from 8/13 to 13/13 and 4/4). A rubric run scored 4/4 on camera. Open: only HO-02 passes the full holdout cleanly. This is reported.
Governance, Security & CI/CD	Met	Governance policy and allow-lists enforced server-side; four required checks; audit logs; secret hook; data classification; `docs/failure-mode-playbook.md`.	An agent call was refused on camera, a change was blocked by CI (PR #24, a deliberate test), escalation and rollback criteria exist, and the red-team set is documented. Open: roles are self-declared, and commit metadata carries a personal email (see the sanitization note).
Right-Tool Decisions & ADRs	Met	`docs/step-classification.md`; ADR-001 to ADR-007; the conversion before and after.	The conversion is measured (264 times faster, $0.173 to $0 per run), and every ADR cites evidence for a rejected alternative. Dated later-evidence sections are marked as added later. Open: ADR-002 is a proposal only.
Production Integration & Tool-Evolution Drill	Met	End-to-end runs on real MCP servers; `module4_doc/tool-evolution-drill.md`; timeout, retry, fallback and budget controls; `docs/runbook.md`.	The drill caught two defects that a manual read missed. The live run in the video passed ($1.76). Open: the live budget guards were never seen stopping a real run, and the fallback was exercised only with a simulated failure.
Iteration Narrative & Impact	Met	`module4_doc/impact-report.md`: five metrics with proxies; improvement cycles (Runs 005 and 006 and the rerun, the reviewer v2, CAL-01, planner v3, build time from 13.2 to 4.8 minutes).	Measured and projected values are kept apart, with assumptions stated. Open: the Module 1 prompt fix is inconsistent (1 pass in 3).
Stakeholder Communication	Met	The one-pager (hours, dollars, risks, next steps); the walkthrough video, 9:54, with an agent call refused on camera.	The video is 6 seconds under the cap. Hours and dollars are projections with named assumptions.
Clarity & Flow	For the grader	The video follows the suggested order: problem, architecture, live run, governance, evaluation, right-tool decisions, impact, operations.	The planned network check was cut for time. The seven PDFs tell the same story.
Design	For the grader	All seven PDFs share one design system, with a legible redrawn orchestration flow, plus a six-slide deck.	None known.

Submission links: the repository and the walkthrough video are entered in Canvas as links. The seven PDFs are also in `submission/` in the repository.
